Útdráttur: Með tilkomu Kárahnjúkavirkjunar mun rennsli aukast í Lagarfljóti og vatnsborð hækka, en minnka í Jökulsá á Dal. Landbrot með Lagarfljóti er nú mjög misjafnt. Milli Lagarfoss og Steinboga er það mjög takmarkað og staðbundið en það er hins vegar talsvert á flatlendinu neðan við Steinboga þar sem áin er mjög bugðótt. Með tilkomu Kárahnjúkavirkjunar er ekki gert ráð fyrir að landbrot breytist mikið við Lagarfljót. Við austurbakka Jökulsár er nú verulegt landbrot en að vestanverðu stýra varnargarðar rennsli árinna. Ekki er líklegt að landbrot aukist við virkjunina. Líklegra er að það minnki nokkuð. Til þess að vakta hugsanleg áhrif Kárahnjúkavirkjunar á landbrot við bakka Lagarfljóts neðan Lagarfoss og Jökulsár á Dal við Húsey hefur grunnástandið verið mælt, þ.e. aðstæður fyrir tilkomu virkjunarinnar. Mælingar hafa verið gerðar á alls 14 stöðum þar sem ástæða þykir að fylgjast með landbroti. Niðurstöður mælinganna eru settar fram í þessari skýrslu og á geisladiski sem fylgir skýrslunni.

SAMANTEKT NIÐURSTAÐNA

Með tilkomu Kárahnjúkavirkjunar mun rennsli aukast í Lagarfljóti og vatnsborð hækka, en minnka í Jökulsá á Dal.

Landbrot með Lagarfljóti er nú mjög misjafnt. Milli Lagarfoss og Steinboga er það mjög takmarkað og staðbundið en það er hins vegar talsvert á flatlendinu neðan við Steinboga þar sem áin er mjög bugðótt. Með tilkomu Kárahnjúkavirkjunar er ekki gert ráð fyrir að landbrot breytist mikið við Lagarfljót. Við austurbakka Jökulsár er nú verulegt landbrot en að vestanverðu stýra varnargarðar rennsli árinna. Ekki er líklegt að landbrot aukist við virkjunina. Líklegra er að það minnki nokkuð.

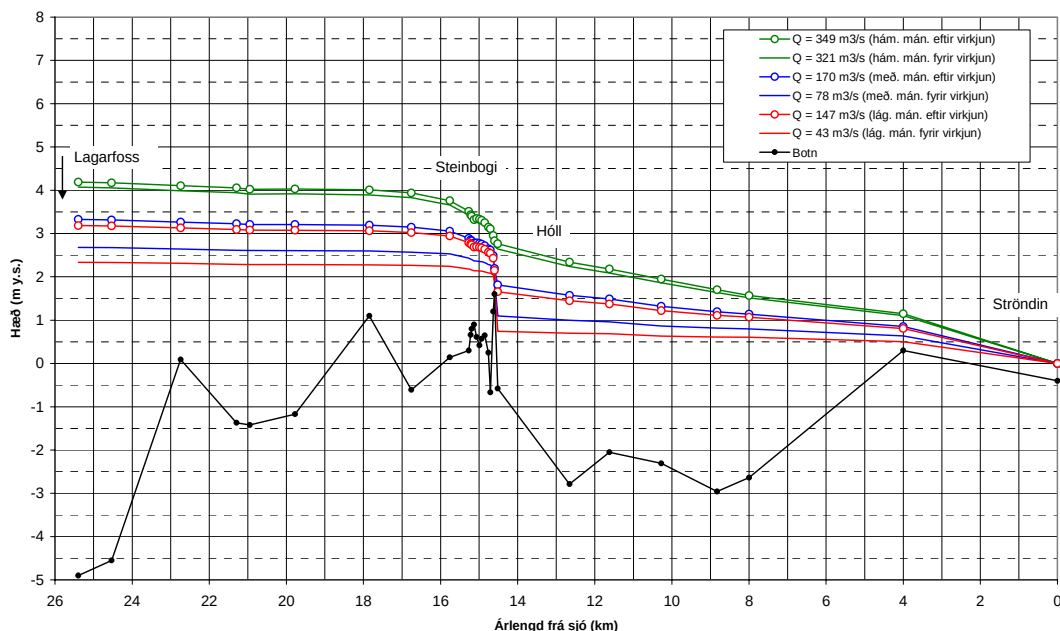

Til þess að vakta hugsanleg áhrif Kárahnjúkavirkjunar á landbrot við bakka Lagarfljóts neðan Lagarfoss og Jökulsár á Dal við Húsey hefur grunnástandið verið mælt, þ.e. aðstæður fyrir tilkomu virkjunarinnar. Mælingar hafa verið gerðar á alls 14 stöðum þar sem ástæða þykir að fylgjast með landbroti. Niðurstöður mælinganna eru settar fram í þessari skýrslu og á geisladiski sem fylgir skýrslunni.

1. INNGANGUR

Með tilkomu Kárahnjúkavirkjunar mun rennsli aukast í Lagarfljóti og vatnsborð hækka, en minnka í Jökulsá á Dal. Áhrif á vatnsborð í Lagarfljóti neðan Lagarfoss eru sýnd á mynd 1 fyrir vatnsmesta mánuð ársins (júní), meðalmánuð og vatnsminnsta mánuð ársins (janúar). Áhrif á vatnsborð eru lítil í júní, en vatnsborð hækkar talsvert þá mánuði sem vatnsminni eru.

Í skýrslu VST og Náttúrufræðistofnunar: *Kárahnjúkavirkjun: Áhrif vatnsborðsbreytinga á gróður og landbrot á Úthéraði – Tillögur um vöktun* (LV-2004/65, Mars 2005) er lagt mat á áhrif Kárahnjúkavirkjunar á gróður og landbrot við Lagarfljót neðan Lagarfoss og Jökulsá á Dal á Úthéraði. Þar er jafnframt gerð tillaga að vöktun vegna landbrots og lagt til að grunnástand, þ.e. aðstæður fyrir tilkomu virkjunarinnar, verði mælt á þeim stöðum, þar sem hugsanlegt er talið að landbrot geti átt sér stað eftir tilkomu virkjunarinnar eða þar sem landbrot er í gangi við núverandi aðstæður.

Í þessari skýrslu er lýst niðurstöðum mælinga á grunnástandi sem gerðar voru í maí og október 2005. Á hverjum mælistaðanna var mælt langsnið eftir árbakkanum auk þess sem mæld voru a.m.k. tvö þversnið í bakkann. Jafnframt var settur hæll í hvert þversnið og staðsetning hans mæld. Hælinn má nota til að mæla á einfaldan hátt breytingu á sniðinu (fjarlægð bakka frá hæll) án nákvæmra GPS mælitækja. Staðsetning mælistaða er sýnd á mynd 2 (bls. 5) og er í samræmi við tillögu sem sett var fram í ofangreindri skýrslu.

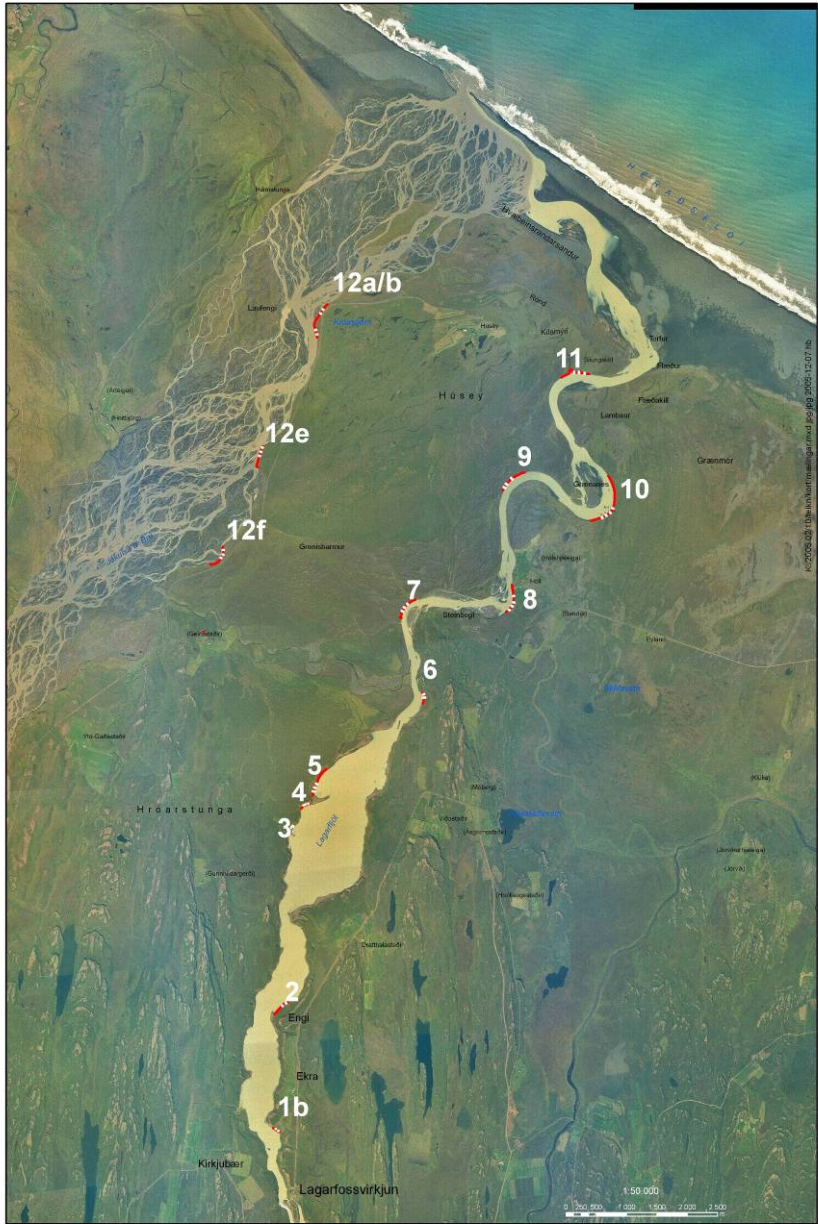

1. Mynd: Vatnsborðshæð í Lagarfljóti neðan Lagarfoss, fyrir og eftir tilkomu Kárahnjúkavirkjunar við meðalrennsli í vatnsmesta mánuði ársins (júní), meðalmánuði og vatnsminnsta mánuði ársins (janúar).

Ekki tókst að gera mælingar á stað merktum nr. 1 á korti í fyrri skýrslu vegna vandamála með mælitæki og á nokkrum stöðum tókst aðeins að mæla inn hælana en ekki öll sniðin. Við Jökulsá á Dal eru mældir dæmigerðir rofbakkar á nokkrum stöðum en alls ekki reynt að mæla alla rofbakka á svæðinu. Mælingar voru ekki gerðar á stöðum 12c og 12d úr fyrri skýrslu, en þess í stað bætt við mælingu á stað 12f (sjá mynd 1 bls. 5).

2. MÆLINGAR

Mælingar voru gerðar með GPS mælitæki af starfsmönnum VST. Mælingarnar fóru fram dagana 28. – 29. apríl 2005 fyrir utan mælingar á svæðum 9 og 11 sem gerðar voru þann 5. október 2005.

Hér verður gerð grein fyrir mælingunum á hverju svæði fyrir sig eins og þau eru skilgreind á mynd 1. Hnit allra mælipunkta eru gefin í viðauka og á meðfylgjandi geisladiski. Hæðarkerfi og hnitakerfi mælinganna er ÍSNET93.

2. Yfirlitskort, staðsetning mælistaða.

2.1 SVÆÐI 1B

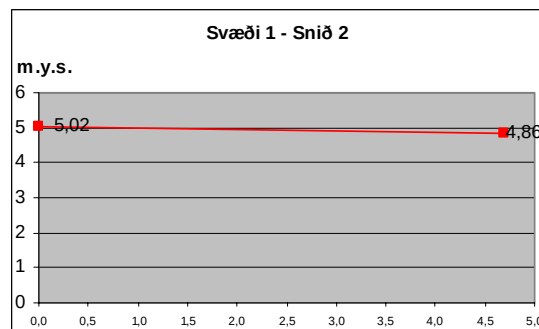

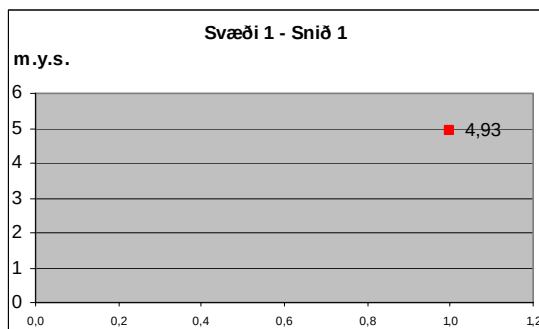

Svæði 1b er á grónum krika við kíl við austurströnd fljótsins, suðvestan við túnið í Ekru. Við bakka fljótsins og kílsins er deiglendi, en þegar fjær dregur bakkanum og land hækkar tekur við þurrlendi.

2.3 SVÆÐI 3

Svæði 3 er við vatnavík við vesturströnd Víðastaðaflóa norðaustur af Gunnhildargerði. Við fljótið er þarna lítt gróinn malarkambur og tjörn innan hans. Annars er fljótsbakkinn að mestur gróinn en ofan hans tekur við hallamýri.

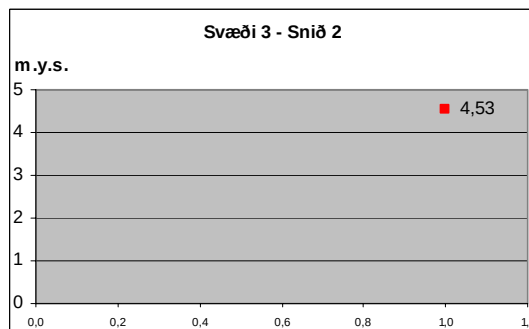

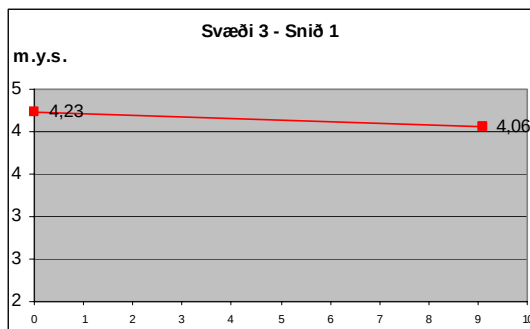

3. Ljósmynd, svæði 3.

2.5 SVÆÐI 5

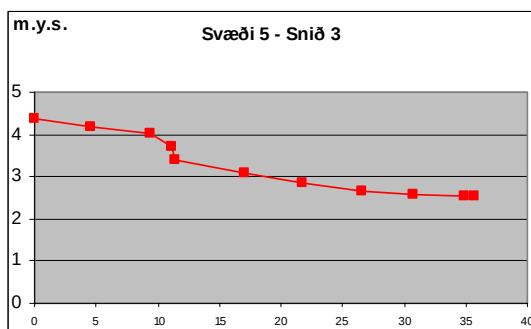

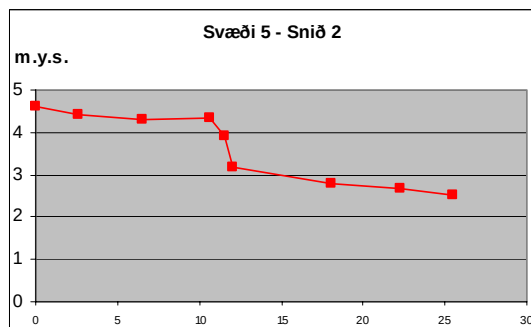

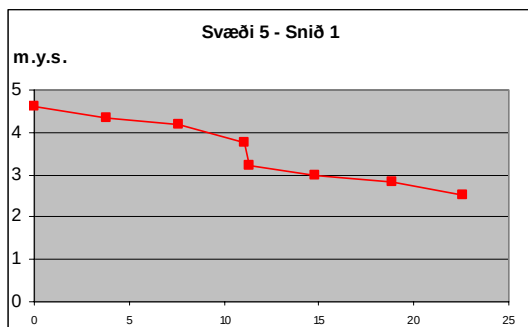

Svæði 5 er í hallamýri og deiglendi við vesturströnd Víðastaðaflóa norðaustur af Gunnhildargerði. Svæðið er um 350 m langt. Syðst er mosaríkt túnvingulsdeiglendi en þegar norðar kemur tekur við víðideigja. Uppsprettur eru í brekkurótum og frá þeim renna lindalækir í fljótið á nokkrum stöðum.

2.12 SVÆÐI 12 E

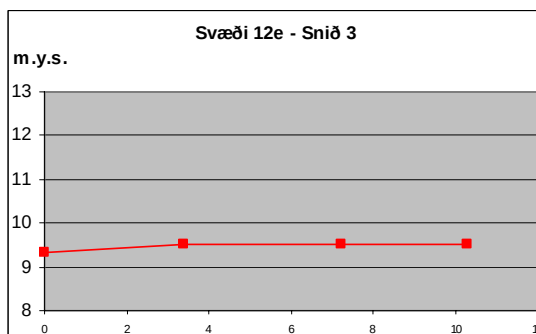

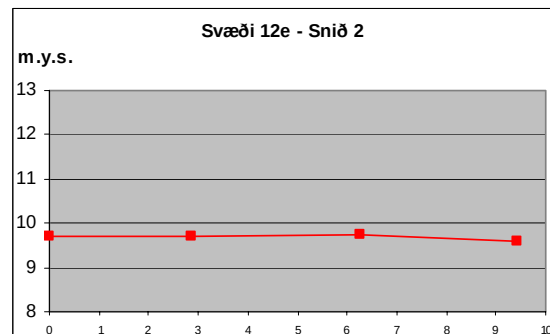

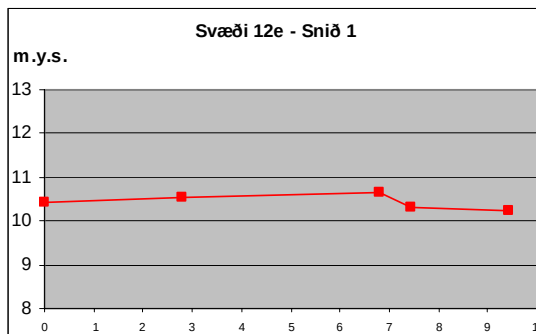

Svæði 12 e er við austurbakka Jöklu suðvestur af Húsey gegnt Hnitbjörgum. Bakkin er gróinn moldarbakki. Verulegt landbrot í gangi við núverandi aðstæður.

14. Ljósmynd, svæði 12 e.
Rofbakki í austurbakka Jöklu gegnt Hnitbjörgum.
Gamli vegurinn út í Húsey u.þ.b. að hverfa út í ána.
Ljós. GGT 8.10.2004

15. Mynd, svæði 12 e
Mældir punktar á bakka og í sniðum.

Tafla 2.13. Snið á svæði 12 E
